

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

Usage guidelines

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

About Google Book Search

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. FOREWORD.

This Index has been compiled for the purpose of making the *Studies from The Rockefeller Institute for Medical Research* more readily available for reading and reference. As the pages of the volumes from I to XVI are not numbered consecutively, it was first necessary to do this, in order to give a proper page reference to each item in the Index. We would suggest, therefore, to those possessing the *Studies* that they page Volumes I to XVI inclusive in accordance with the numbers employed in the Index. To do this will not be a laborious task, as possibly it will not be necessary to page the volumes throughout, in detail. It will suffice, we believe, to page the table of contents, and then to designate in each volume the proper page number for the first page of an article, which can be done with the assistance of the author's section of the Index.

For those who desire to page the volumes completely, it may be added that in the consecutive numbering, all pages—those blank, as well as title pages of articles—have been included; but the inserts and plates have not been included in the numbering. We have also not included the tables of contents, as it is the custom to page these in another series of numerals. The paging for each volume has been begun with the first page of the first article in that volume.
